Enhance Your Tree & Shrub Growth

With Endo/Eco Plus Mycorrhizal Treatment

The word *mycorrhizae* literally means "fungus-roots" and defines the close mutually beneficial relationship between specialized soil fungi (mycorrhizal fungi) and plant roots.

In this association, fungal filaments extend into the soil and help the plant by gathering water and nutrients and transporting these materials back to the roots.

Benefits include:

1. Improved nutrient and water uptake
2. Improved root growth
3. Improved plant growth and yield
4. Reduced transplant shock
5. Reduced drought stress

Tubex Tree Shelters

The twin-walled, solid translucent tubes provide maximum protection from animal browse damage, wind, chemical sprays and equipment.

Natural regeneration of a seedling usually occurs under the shade of its parent where conditions are characterized by lower light intensity, higher humidity, and reduced air movement which combine to reduce planting stress. Tubex tree shelters imitate these conditions.

Made from chemically non-reactive and biologically inert polypropylene that is not harmful to the environment.
